

Arrays

1. Swap.

```
import java.util.Arrays;
public class Problems {
    public static void main(String[] args) {
        int[] arr = {5,3,4,2,1};
        swap(arr,1,2);
        System.out.println(Arrays.toString(arr));
    }
    static void swap(int[] arr, int first, int second){
        int temp = arr[first];
        arr[first] = arr[second];
        arr[second] = temp;
    }
}
```

2. Maximum Value of an Array.

```
static int max(int[] arr){
    int maxVal = arr[0];
    for(int i = 1; i < arr.length; i++){
        if(arr[i] > maxVal){
            maxVal = arr[i];
        }
    }
    return maxVal;
}
```

3. Reverse the Array.

```
static void rev(int[] arr, int index1, int index2){
    int start = 0;
    int end = arr.length - 1;
    while(start < end){
        swap(arr,start,end);
        start++;
        end--;
    }
}
```

Array Lists

1. Example.

```
import java.util.*;
public class ArrayList1 {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        ArrayList<Integer> list = new ArrayList<>();
        for (int i = 0; i < 5; i++) {
            list.add(sc.nextInt());
        }
        System.out.println(list);
        sc.close();
    }
}
```
